

Connecting the Dots: How to improve the traditional Lawful Interception Infrastructures with new Investigation Tools oriented to Social Networks, Deep and Dark Web

Tuesday, 23 May

IAP

International Association of Prosecutors

IPS is an Italian company that designs and manufactures products and solutions for communications monitoring and interceptions.

- Private and independent company
- 30 years experience in tech arena
- Mix of IT, Networking and Security
- In-house development of core technology
- 24x7x365 Technical Support

Technology Transparency and Know-How Transfer

Prosecutors Offices

Supply of Monitoring Centers.
In Italy as managed services.
In the international market as nation-wide turn-key projects.

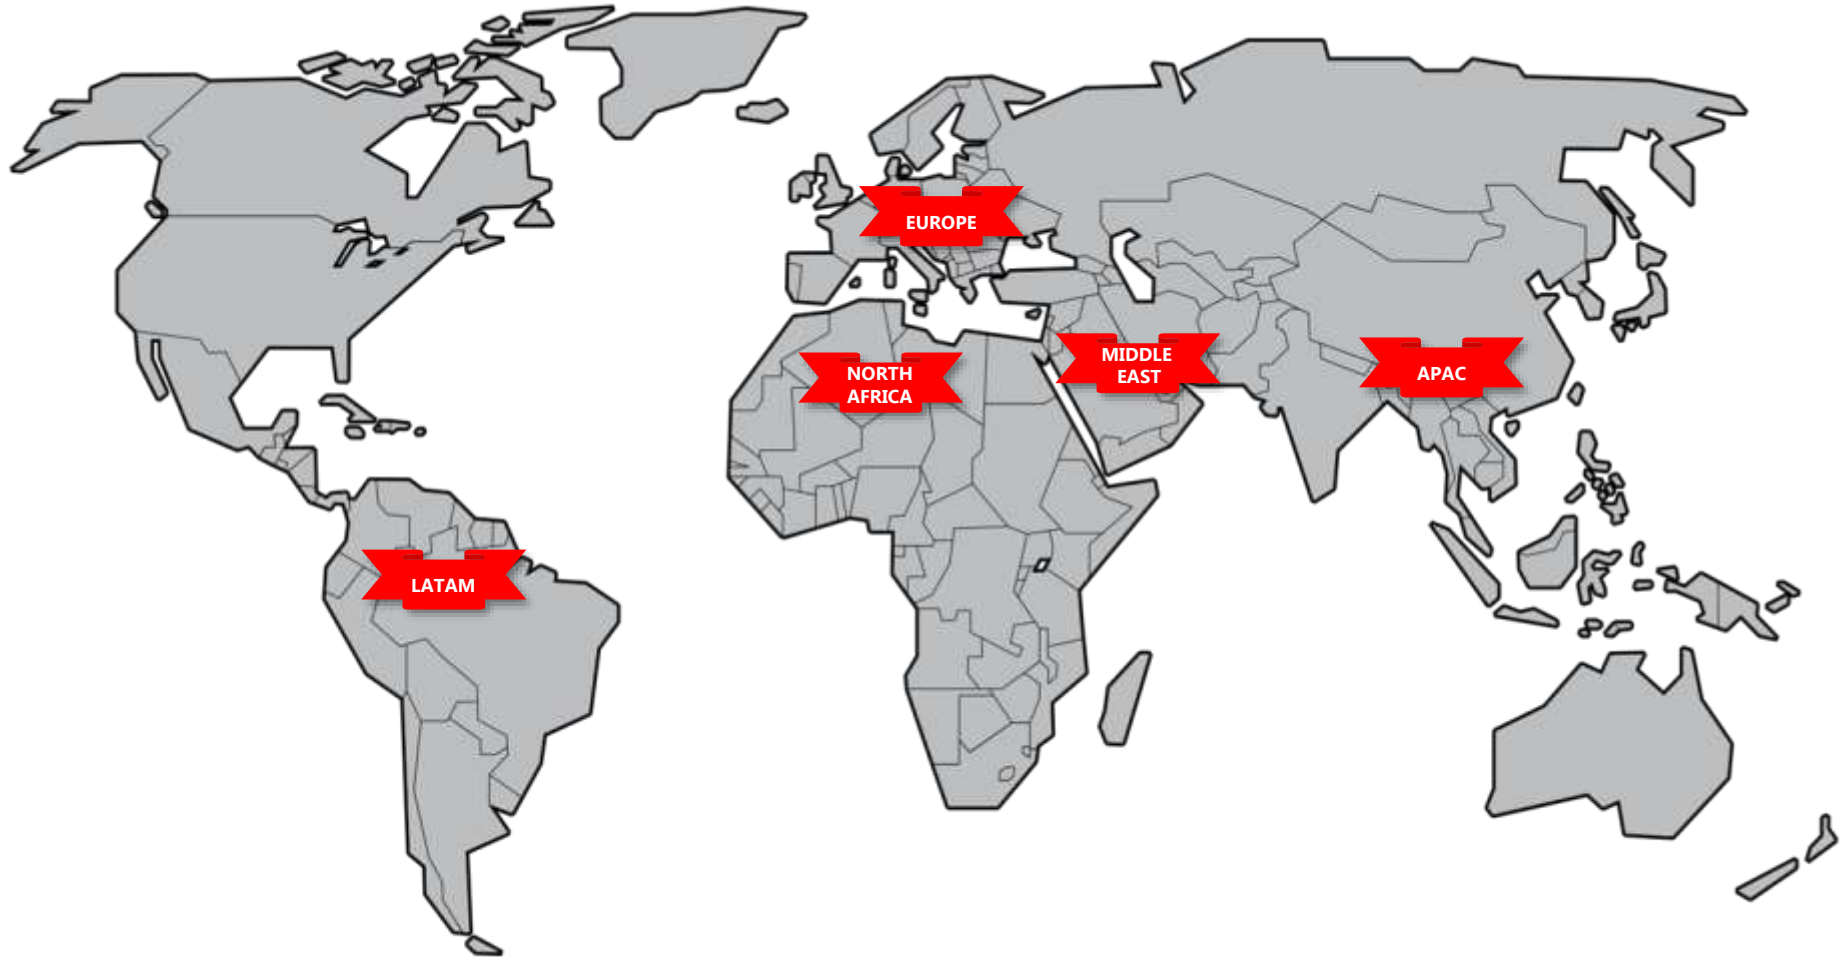

Law Enforcement and Intelligence Agencies

Supply of tactical or strategic solutions to Italian and International agencies.

Telecom Operators and Internet Service Providers

Supply of systems to be installed in the network to provide communication content and relevant information to the above mentioned Government customers.

TRAPANI NUOVA

Secondo tre esperti americani

**Nel 2000 i telefoni
faranno tutto loro**

Leggeremo i giornali attraverso la rete telefonica e potremo anche servircene per le operazioni di banca

Tuesday 26 June 1962 - According to three American experts
In the year 2000 telephones will do everything by themselves.

We will read newspapers through telephone network and we could also use it for banking operations.

The **forecast** was correct,
around 50 years in advance!

According to three American experts.

In the year 2000 telephones will do everything by themselves.

We will read newspapers through telephone network and we could also use them for banking operations

Three managers of the American Telephone and Telegraph Company, engineers J. H. Felker, C. M. Mapes and Dr. H. M. Boettinger, made some foresight on the evolution of telephony towards year 2000, during a radio interview on the national broadcast "Dimension" by C.B.S.

The three experts affirm that, for a start, morning newspapers will be spread directly in "facsimile" through the telephone network. After the breakfast and **read the telephotographic newspaper**, the business man will maybe decide to stay at home to avoid some traffic jam, however without neglecting his activities.

With the help of the "**videophone**", whose screen will be a lot more efficient and more clear than modern televisions, he will be able to stay in contact with the office or even **set up a meeting** with his colleagues or associates in different locations.

But the husband won't be the only one to benefit from the progress. The wife will be able to use the telephone service to avoid tiresome walks to the **shops**. With watchful eyes she will follow shop owners explanations on the color screen of her videophone and she'll analyze the **goods on display**, before taking the **order**.

The three experts foretell that the family of tomorrow will use the telephone also to get at home educational, artistic and cultural channels. **Televisions** with closed circuit tied to the telephone network will spread school lessons, meetings with screenings and **visits to the museum** directly at home. They will also be able to **read the last books** without being forced to go at the library for the loan.

In travels people will use the **telephone on automobiles, airplanes** and in any other means of transportation. They will be able to call any user in any part of the world through direct dialing. However, they won't need to input the number and the area code of the city they are calling. All they will need to do is tell the telephone number and this (the device) will **translate the voice** in electric impulses.

Conversations will absorb just a little part of the traffic on the telephone lines. It's foreseen that yet in 1975 the volume of commercial data broadcast through telephone lines will exceed the data used for conversations. There are "**data-phone**" devices being finalized, able to transmit 3000 words per minute, so that an electronic brain can call on an analogue machine with a speed far more superior than human speed. One of this **machines wired to the telephone network** will be able to read a stock inventory and, once the calculation are done, it will call another machine in the main warehouse to order supplies or the day after.

In the year 2000 people will use the telephone even to do **banking operations**. Checks will be written with magnetic ink that can be read by specific machines in banks. This machines not only will validate the check, they will also record the operation on the personal bank account.

New Digital Payments

Facebook payments are coming to Europe

Hannah Roberts  

🕒 Dec. 8, 2016, 2:41 PM 🔥 778

Facebook has **quietly** secured an e-payments license from the Central Bank of Ireland, signalling that the ability to pay people through the Messenger app (already available in the US) could soon be coming to Europe, [TechCrunch reports](#).

The [Central Bank of Ireland's register](#) shows that the license was authorised to Facebook Payments International Limited (FBPIL) in October for "e-money issuance" and "payment services." FBPIL confirmed the approval of the European license to TechCrunch.

MOBILE PAYMENTS

Facebook Payments Registered as E-Money Entity in Spain

by Fintechnews Switzerland / January 9, 2017

Facebook has registered as an electronic money provider in Spain as the firm seeks to expand its peer-to-peer payments functionalities over Messenger to Europe.

Facebook Payments International Limited (FBPIL) was added to the Bank of Spain's register of e-money entities on December 30, 2016, and follows a license granted by the Central Bank of Ireland.

In October, the Central Bank of Ireland granted a license to FBPIL pertaining to e-money issuing and payment services provision and includes credit transfer, payment transactions and money remittance.

The Irish license applies throughout all 27 EU member states, with the firm only needing to notify the respective central banks to validate the authorization.

Confirming the approval of the European license, Facebook wrote in an email to TechCrunch:

"The license enables us to roll out products like charitable donations on Facebook or peer-to-peer payments via Messenger in Europe, as we have in the U.S. The license authorizes FBPIL to issue donations from Facebook users to charities registered in the European Economic Area (EEA) only; and peer-to-peer payments, within the EEA."

What is Europe doing ?

Privacy vs Security

Digital Single Market – Stronger privacy rules for electronic communications

Brussels, 10 January 2017

Questions and Answers

Why is the Commission modernising EU digital privacy rules?

Since the last revision of the ePrivacy Directive in 2009, electronic communications services have evolved significantly. Consumers and businesses are relying more and more on internet based services to communicate, such as instant messaging, voice over IP and web-based e-mail, but these services are not covered by current ePrivacy rules.....

Europeans are concerned about their privacy.....

What is the Commission proposing?

The cornerstones of the proposed rules on Privacy and Electronic Communications are:

All electronic communications must be confidential. Listening to, tapping, **intercepting**, scanning and storing of for example, text messages, emails or voice calls **will not be allowed without the consent of the user**. The proposed Regulation also specifies when processing of communications data is exceptionally permitted and when it needs the consent of the user.

EU to propose new rules targeting encrypted apps in June

By [Catherine Stupp](#) | [EURACTIV.com](#) 29 mar 2017

EU Justice Commissioner Vera Jourová said she will announce “three or four options”

Non-legislative measures will be provisional “to have a quick solution”, since negotiations over EU laws can drag on for years before they are passed.

“At the moment, prosecutors, judges, also police and law enforcement authorities, are dependent on whether or not providers will voluntarily provide the access and the evidence. This is not the way we can facilitate and ensure the security of Europeans, being dependent on some voluntary action,” Jourová said.

Pressure from UK, France and Germany making internet operators subject to the same requirements as telephone operators.

Five member states want EU-wide laws on encryption

Hungary, Croatia, Italy, Latvia and Poland

*Gilles de Kerchove, the EU’s anti-terrorism coordinator, said “it’s much too early to say that **backdoor** would be a solution” for accessing encrypted data of messaging services like WhatsApp and Telegram.*

ePrivacy directive

In Jan 2017, the Commission proposed changes to the EU ePrivacy law affecting telecoms services and **extended** the eight-year-old privacy rules for the first time **to internet services.**

“three or four options” to safeguard Privacy and Security

- Only standard encryption (SSL/https).
- Proprietary or End-to-End encryption blocked on the net.
- *Server of the providers installed within the country (preferred but difficult).*
- State based backdoor (each device operating in a country).
- State based digital certificate (for all services used in a country).

It's clear: we are in an uneven fight.

- Until national or international regulation will ever be in place, “**non-legislative measures**” must be taken
- We called them “**Unconventional IP Intelligence**” and is a mix of:
 - **Metadata extraction** from network traffic monitoring
 - **Open Source Intelligence**
 - **Device Infection**
 - **Data Fusion**

Results?

France - Arrested thanks to photos posted on Facebook

He was enjoying in Morocco the spoils of 1,700,000 Euros, as result of a robbery in Cannes, last year.

Thanks to the photos published on the social network, French agents were able to track him down, ending his fugitive.

The thief had been convicted by the French authorities to ten years in prison.

Data Fusion

**Information will be always harder to get
a new investigative approach is needed
more like “intelligence analyst”
than traditional “judiciary police”**

According to research at Cambridge University, it doesn't matter in what order the letters in a word are, the only important thing is that the first and last letter be in the right place. The rest can be a total mess and you can still read it without a problem. This is because the human mind does not read every letter by itself, but the word as a whole.

Thank you!

For any further clarification please contact us.
